Flawed statistics and censorship

The entire mainstream covid narrative was driven by easily manipulated statistics based on flawed definitions, data and modelling.

Covid was never as lethal as claimed, the testing was never accurate, and the vaccines are neither safe nor effective as claimed.

The same type of data manipulation and flawed modelling has been used for many years to exaggerate the 'climate crisis' and the impact of humans on it.

What has been very effective is the mass censorship of dissenting voices who raised concerns about both the climate narrative and the covid narrative.

The same censorship is being used to shut down evidence about how unnecessary and devastating the net zero 2050 target will be for normal people.

Academics/elitists delighted in covid lockdowns – ‘opportunity for the Great Reset’

COVID lockdown causes record drop in carbon emissions for 2020

Carbon dioxide emissions from oil, gas and coal this year are predicted to reach approximately 34 billion tons, a 7 percent drop from fossil emission levels in 2019. Emissions from transport account for the largest share of the global decrease.
